

Frontend Engineering Assessment: Signup Wizard Replication

1. Overview

This assessment evaluates your ability to build high-fidelity, functional, and user-centric web interfaces. You are required to *replicate* the **Signup Wizard** from an existing application in a responsive website. Your primary objective is to ensure visual parity while implementing robust technical logic for state management and validation.

2. Reference Materials

- **Sample Application:**
<https://play.google.com/store/apps/details?id=com.pro.nubpack>
- **Task:** Create a web-application that has the same landing page mechanism, a similar terms and conditions page, and the same 4-step signup form there is on the given above application. Use of AI tools is encouraged.
- **Assets:** For background and logos, you may use any commercially available assets on the internet, Poppins for fonts.
- **Assessment Criteria:** You are expected to replicate the app's signup form in the web-app, ensuring that all functional and UI details are carried over accurately. This includes form validation, error handling, alerts, input behavior, loading states, success and failure scenarios, going backward in the form, and overall user experience. **This should not be limited to a direct replication, identifying and improving any details, interactions, usability issues, or edge cases you find along the way(like how OTP screen needs to look better, or how age less than 18 is not prompted), while keeping the overall experience consistent with the app.**

NOTE: This is a front-end only exercise.

3. Technical Requirements

A. Core Functionality

- **Progressive Disclosure:** Implement the wizard as a multi-step process.
- **Wizard Logic:** Subsequent steps should collect additional profile details (e.g., Name, Age, Pronouns) only after the initial email verification or login.
- **Visual Fidelity:** The website replication must be indistinguishable from the app's design in terms of typography, spacing, color palettes, and component behavior.

B. Form Validation & Logic

You must implement comprehensive validation including, but not limited to:

- **Real-time Validation:** Validate email formats and required fields as the user types (on-blur or on-change).
- **Error Handling:** Display clear, contextual error messages beneath fields and utilize global error alerts (e.g., Toasts or Banners) for failed submissions.
- **Input Constraints:** Implement character limits, numeric-only inputs for years/phones, and prevent whitespace-only submissions.
- **Loading States:** Show a similar spinner on buttons during "submission" simulation to prevent duplicate entries.
- **Cross-Field Logic:** Ensure dependencies (e.g., selecting a state filters available cities/colleges) are handled smoothly.

C. Advanced User Experience (UX)

- **Responsive Design:** The form in the final website must be fully functional and aesthetically pleasing on mobile, tablet, and desktop viewports.
- **Success Feedback:** Provide a clear success state or redirect once the profile is "completed."

4. Submission Instructions

You need to submit the public access **link to the screen recording** of your local project for no more than 5 mins covering the form, errors, validation, etc.. Along with that you

can also share the **link to the AI chat** that you used to replicate the app's signup form to a website.

Submission Form: <https://forms.gle/UFK1tUAzVBfStptf9>

Your work is yours. We won't ask you to share or submit your source code as part of this task. We want to respect your time, effort, and intellectual property. If we move forward with your candidacy, we may request the relevant code at that stage for a deeper technical discussion and evaluation, with appropriate confidentiality.
